

Cosmin Turculeanu

Technical Delivery / Automation & Systems / Bridging

Business and Engineering

6.5 years running global operations at Dell — hit 95% production targets, drove 30-35% recovery rate increases across 5 global projects, coordinated cross-regional teams. Moved deliberately into automation and delivery: built the function from scratch as one of two people, then shifted into owning the full delivery cycle — intake to sign-off — as the team grew. Built reporting pipelines that cut manual work by 80%, designed workflow automation across 25+ desks, and still write the code when the backlog demands it. Currently building x-Data Pulse, a multi-tenant SaaS ticketing platform. Targeting **Technical Project Lead** and **TPM** roles where owning the full cycle — from requirements to delivery — is the job.

Core Expertise

DELIVERY

Technical Project Lead

Own the full cycle — intake, requirements, stakeholder sign-off, ticket, delivery. Started a new automation function from scratch and grew it while staying close enough to the work to contribute when needed.

AUTOMATION

Workflow Automation

Find the broken process, build the fix. Python pipelines, n8n workflows, LiveVox integrations — cut 80% of manual reporting and removed human intervention from operational routing entirely.

OPERATIONS

Global Operations Management

6.5 years running Dell's reverse logistics across 5 global regions. Set targets, owned the numbers, coordinated teams across time zones. Moved recovery rates from the low 70s to 93-96%.

DATA & REPORTING

Pipelines & Dashboards

Build reporting pipelines from raw operational data to Looker dashboards — SQL, Python, Pandas. Cut manual reporting work by 80%. If it can be measured, it should be automated.

Technical Delivery Lead

Jul 2023 - Present

D&S Global Solutions, a Cadex Company

Moved into this role by design — wanted to shift from pure operations into product and automation delivery. Joined as one of two people standing up a new function from scratch. As the team grew to four, my focus shifted to owning the delivery cycle: intake, requirements, stakeholder alignment, ticket creation, and monitoring through sign-off. Still contribute directly to automation when the backlog demands it.

- Manage a cross-departmental backlog of automation requests — translate business problems from Operations, Client Services, and Legal into technical requirements and drive delivery from intake to sign-off
- Diagnosed workflow bottlenecks responsible for **~10% excess in monthly operational costs** — the work below is what fixed them
- Defined requirements and led delivery of automated reporting pipelines (**Python, SQL, Looker**), cutting manual reporting time by **80%** across daily, weekly, and monthly cycles
- Designed and implemented **n8n** workflow automation to rebalance workloads dynamically across 25+ desks — removed manual intervention entirely from operational routing
- Built account prioritization in **n8n** feeding directly into **LiveVox** — agents start each day with a pre-built, ranked call queue and auto-dial through it without manual setup; RPC rate up **8%**, tracked in Looker

Global Operations Manager

Jun 2020 - Aug 2023

Dell - Reverse Logistics Department (via D&S Global Solutions)

Managed Dell's reverse logistics globally. Set production targets, coordinated cross-regional teams, balanced competing priorities between revenue and production.

- Raised global production target to **95% average** across all regions
- Drove a **30-35% cumulative increase in global recovery rates** across 5 projects (US, EMEA, APJ, LATAM, GDO) — moved regional averages from the low 70s to 93-96% through process improvements and full ownership of target-setting
- Led cross-functional teams across regions - balanced what revenue wanted vs what production could deliver
- Acted as business-side owner for IT-delivered tools — defined the problem, set requirements, validated delivery, and owned the outcome

Operations Supervisor

Jan 2017 - Jun 2020

Dell - Reverse Logistics Department (via D&S Global Solutions)

Ran day-to-day reverse logistics operations. Kept teams on track, made sure product returns didn't get stuck or lost.

- Mapped and resolved workflow gaps across multiple operational areas, eliminating the recurring process failures costing the most time and money
- Bridged frontline teams and management by converting reported problems into fixes with named owners, keeping the gap between "this is broken" and resolved as short as possible
- Tracked production metrics daily and flagged performance drops before they escalated, keeping regional targets on course
- Built the team habits and daily routines that delivered a **15% recovery rate improvement** — working within approval chains as Supervisor, changes had to go through sign-off, which limited pace but built the operational foundation carried forward into the Manager role

Current Projects

x-Data Pulse - SaaS Ticketing Platform

Personal Project

Multi-tenant ticketing platform — each company gets isolated data, shared infrastructure. Built end-to-end: architecture, backend, auth, real-time updates.

- Built on **FastAPI**, **WebSockets**, and **Google OAuth** — real-time ticket updates and secure per-company authentication
- Multi-tenant architecture: multiple companies on one platform with full data isolation
- Currently in security audit phase before release — demo available in portfolio

80% Complete

Freelance Automation Projects

Client Work

Build workflow automation solutions for clients using n8n, APIs, and database integrations.

- Built a **fleet management system** for Cesivo (Romanian energy & agriculture company) using n8n — tracks vehicle insurance, inspections, and maintenance schedules with automated Telegram alerts for expiring documents
- Integrated **Google Gemini LLM** with their fleet database to create an assistant that answers operational queries in natural language
- Designed workflows with conditional routing, database operations, and multi-step automation logic
