3+ years owning a cross-departmental automation backlog across **25+ desks**, prioritizing by business value and working directly with engineers to ship it. Before that, 6.5 years on Dell's reverse logistics account. As Program Manager, I got production to a **95%** average and recovery rates up **30-35%** across 5 regions. Looking for roles where owning the backlog outcome is part of the job.

Key Programs

PRODUCT MANAGEMENT

Legal Automation Program

- The Legal team wanted to stop doing contract and letter work by hand
- Agreed to build it when Legal proposed it
- Wrote the backlog, project plan and communication plan from their scope
- Governed the full project lifecycle from initiation through closure, managing scope, timeline, and stakeholder expectations across an 8-month period with weekly standups and sprint reviews
- Prioritized 6 legal and compliance workflows into a single delivery roadmap, sequencing database updates, letter and email generation, contract reviews, and legal approvals by business impact
- Managed the full backlog in Jira from initial intake through to technical sign-off, shifting the client's teams from doing the work manually to reviewing automated output
- Went live after 8 months. The team still maintains it

PROGRAM MANAGEMENT

Dell Reverse Logistics Program

- Reverse logistics program spanning US, EMEA, APJ, LATAM for Dell
- Authored and deployed operational guidebook used across regional teams
- Held firm on out-of-scope requests to protect delivery boundaries and keep clients aligned on agreed scope
- Set production targets within budget constraints, balancing capacity limits and revenue requirements to meet financial goals
- Tracked daily output metrics and intervened in underperforming streams to recover volume
- Improved recovery rates by 30 to 35 percent while sustaining 95 percent average production attainment

REGIONAL EXPANSION

Regional Program Expansion

- Launched Dell's reverse logistics function across EMEA and APJ from the ground up, adapting an existing program model to both regions
- Built each region end-to-end by adapting the global reverse logistics framework to fit regional context, covering intake, execution, monitoring, and control
- Set up performance tracking as a live management tool, feeding directly into planning, capacity decisions, and daily execution
- Monitoring never closed after launch. It became a permanent operational loop feeding real-time data into daily planning
- Delivered consistent results across both regions under Dell's global governance structure

Experience & Skills

Core Competencies: Product Management, Product Backlog Ownership and Prioritization, Agile Delivery (2-Week Sprints, Scrum Ceremonies), Requirements Gathering and Translation, Jira Backlog Management and Sprint Planning, Stakeholder Management Across Operations, Legal, and Client Services, Cross-functional Team Leadership, Process Mapping and Optimization

Tools & Platforms: Jira, Looker, n8n, SQL, Python, PostgreSQL, REST API and webhook integrations, agentic AI development tools

Product Manager

D&S Global Solutions, a Cadex Company

Jul 2023 - Present

Joined as one of two people building the automation function from scratch. Now own the product backlog end to end and run 2-week sprints and scrum ceremonies with engineers and analysts.

- Own a cross-departmental product backlog of automation requests, translate business problems from Operations, Client Services, and Legal into technical requirements and prioritize by business value
- Argued against automating a first-party project that was only running for 3 months. Not enough return for the build time
- Identified workflow risks causing **~10% excess in monthly operational costs**, then fixed them

- Defined requirements and led delivery of automated reporting pipelines (**Python, SQL, Looker**), cutting manual reporting time by **80%** across daily, weekly, and monthly cycles
- Scoped and delivered an **n8n** workflow that rebalances work across 25+ desks. Nobody routes work by hand anymore
- Owned the account prioritization project in **n8n** that feeds **LiveVox**. Agents start each day with a ranked call queue and auto-dial through it with no setup. RPC rate up **8%**, tracked in Looker
- Diagnose database translation errors, document the root cause, and create detailed issues for DevOps to resolve

---

Program Manager

Dell - Reverse Logistics Department (via D&S Global Solutions)

Jun 2020 - Aug 2023

Managed Dell's reverse logistics globally. Set production targets, coordinated cross-regional teams, and navigated stakeholder governance across revenue, production, and client requirements.

- Raised global production target to **95% average** across all regions
- Drove a **30-35% cumulative increase in global recovery rates** across 5 projects (US, EMEA, APJ, LATAM, GDO), moved regional averages from the low 70s to 93-96% through process improvements and full ownership of target-setting
- Led cross-functional teams across regions - balanced what revenue wanted vs what production could deliver
- Acted as business-side owner for IT-delivered tools, defined the problem, set requirements, validated delivery, and owned the outcome

---

Operations Supervisor

Dell - Reverse Logistics Department (via D&S Global Solutions)

Jan 2017 - Jun 2020

Ran day-to-day reverse logistics operations. Kept teams on track and product returns moving through the system without delays.

- Mapped and resolved workflow gaps across multiple operational areas, eliminating the recurring process failures costing the most time and money
- Connected frontline teams and management by converting reported problems into fixes with named owners, keeping the gap between "this is broken" and resolved as short as possible
- Tracked production metrics daily and flagged performance drops before they escalated, keeping regional targets on course
- Built the team habits and daily routines that delivered a **15% recovery rate improvement**, working within approval chains as Supervisor, changes had to go through sign-off, which limited pace but built the operational foundation carried forward into the Manager role

Current Projects

x-Data - Self-Hosted Automation Platform (Personal Project)

I scoped what needed to get built and in what order, then had AI agents as my build team to actually build it, running on my own VPS across 4 separate services:

- React frontend
- Backend service handling Stripe payments
- Backend service handling Zoho scheduling
- Self-hosted n8n instance running the automation

Stripe stands alone, handles payments and nothing else. Zoho sends bookings over to n8n through a webhook. n8n has a second job too, a live AI chat demo that talks to the browser directly, no backend in the middle. Includes x-Data Pulse, a multi-tenant support ticketing tool, still going through a security audit before it ships.

Freelance Automation Projects (Client Work, 2023 - Present)

Built a fleet management and alerting system for Cesivo (Romanian energy & agriculture company), plus an LLM-based natural-language assistant over their fleet database.
